For the convenience of storage, Cassette and Sample Tubes can be stored separately.

OneStep

H. Pylori Antigen

RapiCard™ InstaTest

Cat # 118564-1

Immunochromatographic rapid assay for the Detection of Helicobacter pylori Antigens in Human Stool Specimens

INTENDED USE
Cortez Diagnostics OneStep H. pylori Antigen RapiCard™ InstaTest is an in vitro qualitative immunochromatographic assay for the rapid detection of Helicobacter pylori antigens in human stool specimen. The test results are intended to aid in the diagnosis of H. pylori infection, to monitor the effectiveness of therapeutic treatment and to confirm the eradication of H. pylori in peptic ulcer patients.

INTRODUCTION
Helicobacter pylori is a corkscrew-shaped, gram-negative rod that lives in the mucous layer of the stomach. H. pylori infection is now accepted as the most common cause of gastritis, and is etiologically involved in gastric ulcer, duodenal ulcer, gastric adenocarcinoma and primary gastric B-cell lymphoma.¹ ²
The organism is very common, infected at least half of the world’s population. H. pylori infection is typically acquired in childhood. Once acquired, infection persists chronically, probably continuing in the
stomach throughout life. The damage to gastric structure and function of stomach is constant and
direct. Approximately one in six of *H. pylori* infection develops peptic ulcer disease and a small portion
of *H. pylori* infection leads to gastric cancer. The diagnostic tests for *H. pylori* can be classified into two categories: Invasive and Noninvasive tests. Direct detection by invasive test procedures requires an endoscopy and biopsy specimens from antrum
and stomach body. The presence of *H. pylori* is then confirmed by direct culture, histological
examination or rapid urease test. The endoscopy and biopsy specimens offer direct detection of active
*H. pylori* infections. Although the procedure is highly specific and high positive predictive value, the cost
and discomfort to the patients are very high.

The most widely available noninvasive test is probably the serological based test. The serology test
detects *H. pylori* specific IgG antibody in patient serum with current or prior infection. Serology test
is a simple, convenient test with relative high sensitivity. The main limitation of serology test is the
inability to distinguish current and past infections. Antibody may be present in the patient’s serum long
after eradication of the organism. The urease breath test (UBT) with $^{14}$C or $^{13}$C labeled urea, is a
noninvasive test based on the urease activity of the organism. UBT detects active *H. pylori* infection
and is highly sensitive and specific. The UBT requires a high density and active bacteria and should not
be performed until 4 weeks after therapy to allow residual bacterial to increase to a sufficient number
for detection.

OneStep *H. pylori* Antigen RapiCard™ InstaTest is an immunochromatographic assay that uses
antibody-coated colloidal gold to detect the presence of *H. pylori* antigens in stool specimens. The test
detects directly antigens in specimens for an active infection. The test is simple and easy to perform
and the test results can be visually interpreted within 15 minutes.

**PRINCIPLE OF THE TEST**

OneStep *H. pylori* Antigen RapiCard™ InstaTest is a sandwich solid phase immunochromatographic
assay. To perform the test, an aliquot of diluted stool sample is added to the sample well of the test
cassette. The sample flows through a label pad containing *H. pylori* antibody coupled to red-colored
colloidal gold. If the sample contains *H. pylori* antigens, the antigen will bind to the antibody coated on
the colloidal gold particles to form antigen-antibody-gold complexes. These complexes move on the
nitrocellulose membrane by capillary action toward the test line region on which *H. pylori* specific
antibodies are immobilized. As the complexes reach the test line, they will bind to the antibody on the
membrane in the form of a line. A second red control line will always appear in the result window to
indicate that the test has been correctly performed and the test device functions properly. If *H. pylori*
antigen is not present or lower than the detection limit of the test, only the control line will be visible. If
the control line dose not developed, the test is invalid.

**MATERIALS PROVIDED**

1. OneStep *H. pylori* Antigen RapiCard™ InstaTest
   Each cassette contains a test strip with *H. pylori* specific antibody on the test region of the
   membrane and colored *H. pylori* antibody-gold conjugate pad.
H. pylori Antigen RapiCard™ InstaTest Sample bottle

2. Sample bottle
   Each sample bottle contains 1 ml of stool specimen collection buffer. Store at 2-8°C

MATERIALS NOT PROVIDED
1. Specimen collection container
2. Timer.

WARNINGS AND PRECAUTIONS
1. For in vitro diagnostic use.
2. Wear protective glove while handling kit components and test specimens.
3. Patient specimens and inactivated Positive Control may contain infectious agents and should be handled and disposed of as potential biohazards.
4. Do not use kit components beyond expiration date.
5. Dispose all used materials in appropriate container. Treat as potential biohazard.

STORAGE INSTRUCTION
1. The expiration date is indicated on the package label.
2. Store Sample Collection Tubes at 2-8°C.
3. Test device can be stored at 2-30°C.

SPECIMEN COLLECTION AND STORAGE
Stool specimens should be collected in containers that do not contain media, preservatives, animal serum or detergents as any of these additives may interfere with the OneStep H. pylori Antigen RapiCard™ InstaTest. Specimens may be stored at 2-8°C for 3 days without interfering with the assay performance. For long-term storage of specimens, -20°C or colder is recommended. Repeated freezing and thawing of specimens is not recommended and may cause erroneous results. Do not store specimens in self-defrosting freezers.

REAGENT PREPARATION
Bring all reagents, including test device, to room temperature (20-30°C) before use.
SPECIMEN PREPARATION
1. Unscrew the sample bottle, use the attached applicator stick attached on the cap to transfer small piece of stool (5-6 mm in diameter; approximately 100 mg – 200 mg/0.1-0.2 g) into the sample bottle containing specimen preparation buffer.
2. Replace the stick in the bottle and tighten securely. Mix stool sample with the buffer thoroughly by shaking the bottle for a few seconds.
   
   Note: Watery or diarrhea specimens are inappropriate for testing.

PROCEDURE
1. Bring all materials and specimens to room temperature (8 – 30°C).
2. Remove the Cassette from the sealed foil pouch.
3. Hold the sample bottle upright with the tip point toward the direction away from the test performer, snap off the tip.
4. Hold the bottle in a vertical position over the sample well of the Cassette, deliver 3 drops (120 -150 µL) of diluted stool sample to the sample well.
5. Read the result within 15 minutes. A strong positive sample may show result earlier.

INTERPRETATION OF RESULTS
Positive result: A distinct pink colored band appears on test line regions, in addition to a pink line on the control line region.
Negative result: No line appears in the test line region. A distinct pink line shows on the control line region.
Invalid: The control line next to the test line does not become visible within 15 minutes after the addition of the sample.

QUALITY CONTROL
1. The control band is an internal reagent and procedural control. It will appear if the test has been performed correctly and the reagents are reactive.
2. Good Laboratory Practice recommends the daily use of control materials to validate the reliability of the device. Control materials which is not provided with this test kit may be commercially available.
LIMITATIONS
1. The test is for qualitative detection of H. pylori antigen in stool sample and does not indicate the quantity of the antigens.
2. The test is for in vitro diagnostic use only.
3. The test result should be used only to evaluate with patient with signs and symptoms of gastrointestinal disease. A definitive clinical diagnosis should only be made by the physician after all clinical and laboratory finding have been evaluated.

EXPECTED VALUES
Helicobacter pylori infects more than half the people in the world. The prevalence of the infection varies among countries and among different groups within the same country. The prevalence rate in the United States suggests an incidence of infection of 2%. The lifetime prevalence of peptic ulcer disease is about 12% in men and 9% in women. Studies have found that more than 90% of patients with duodenal ulcer and 80% of patients with gastric ulcer are infected with H. pylori.

OneStep H. pylori Antigen RapiCard™ InstaTest detects the presence of H. pylori antigens in stool specimens. Expected values for any given population should be determined for each laboratory. The positivity rate of any given laboratory may vary depending on geographic location, ethnic group, and living environment.

PERFORMANCE CHARACTERISTICS
Sensitivity and Specificity
OneStep Helicobacter pylori Antigen RapiCard Insta Test was evaluated on 170 adults. The test results were compared to diagnosis of H. pylori infection by reference tests, urease breath test and histology tests. Patients were considered positive if both rapid urease and histology tests were positive. Patients with both negative urease breath test and histology tests were considered negative. Among fifty (50) positive samples and one hundred and twenty (120) negative samples, OneStep H. pylori Antigen RapiCard™ InstaTest showed 94.0% clinical sensitivity and 96.7% specificity. The accuracy is 97.5%.

Sensitivity = 94.0% (47/50)
Specificity = 96.7% (116/120)
Positive Predictive Value = 92.2% (47/51)
Negative Predictive Value = 97.5% (116/119)
Accuracy = 95.9% (163/170)

Reproducibility
Reproducibility of OneStep H. pylori Antigen RapiCard™ Insta Test was determined using negative, low positive, and high positive samples along with negative and positive controls. These samples were tested in replicates of 8 in a blind study by 5 operators working independently in the same laboratory. The agreement of the expected result was 100%.
Assay Specificity
Following bacterial and viral strains were used to test the specificity of OneStep H. pylori Antigen RapiCard InstaTest. Positive and negative stools were spiked with $>1 \times 10^8$ organism/ml and tested by OneStep H. pylori Antigen RapiCard™ InstaTest. H. pylori positive stool remained positive with the spiked organisms. Negative stool remained negative with the spiked organisms.

Microorganism and virus tested
- Adenovirus type II
- Campylobacter fetus
- Campylobacter lari
- Citrobacter freundii
- Clostridium perfringens
- Enterobacter cloacae
- Escherichia fergusonii
- Helicobacter cinaedi
- Klebsiella pneumoniae
- Providencia stuartii
- Proteus vulgaris
- Pseudomonas fluorescens
- Salmonella (Group B)
- Salmonella hiversum (Group N)
- Salmonella typhimurium
- Shigella boydii
- Shigella flexneri
- Serratia liquefaciens
- Staphylococcus aureus (Cowan)
- Staphylococcus faecalis
- Staphylococcus epidermidis
- Yersinia enterocolitica
